chemical charges are added to the system since fresh phosphate may precipitate along with that which has already occurred. The readings for pH and phosphate are typically out of control during hideout when the load is increased, and then again when it is decreased.

QUESTIONS AND ANSWERS Phosphate Hideout

Get Free Questions And Answers

Phosphate hideout is primarily a result of a temperature-dependent interaction of sodium phosphate compounds with iron oxide, which creates a low solubility reaction product that precipitates in high heat flux areas or under high load conditions. At lower loads and lower heat fluxes, the precipitates return to solution.
